Abstract

In the present paper, we have studied a class $\mathcal{T}^{\nu, \mu, \gamma}(n, \alpha, \beta)$ of analytic and univalent functions as defined by making use of the generalized Ruscheweyh derivatives in the unit disk $U$ and obtain some sharp results including coefficient inequality, Radii of starlikeness, convexity and close-to-convexity, distortion theorem, extreme points, closure theorem and Hadamard product.

Keywords and phrases: univalent function, generalized Ruscheweyh derivatives, radius of starlikeness, extreme points, distortion theorem, closure theorem, Hadamard product.
